Summary

Senior Frontend Engineer with 5+ years building and modernizing large-scale enterprise web applications in React and TypeScript. I own the frontend architecture on a legacy modernization programme at Vodafone, migrating a live jQuery application to React module by module, with no rewrite and no downtime. Most engineers who can build a frontend have never had to change one that is already running and cannot be stopped. That is what I specialise in: extracting business rules from undocumented legacy code, preserving behaviour through migration, and proving it with tests. Background in Angular, RxJS and NgRx on customer-facing telecom applications for European markets.

Skills

Core: React, TypeScript, Angular, JavaScript (ES6+), frontend architecture, legacy modernization, micro-frontend architecture
Also experienced with: Vue.js, Next.js, Nuxt.js, jQuery, RxJS, NgRx, Pinia, Vuex
Languages and Markup: HTML5, CSS3, SCSS/Sass, Tailwind CSS, Bootstrap, responsive web development
APIs and Data: REST APIs, fetch, AbortController, GraphQL, API integration, CMS integration
Testing: Vitest, Jest, React Testing Library, Playwright, Storybook, unit testing, end-to-end testing, regression testing
Tooling and Build: Vite, Webpack, ESLint, Prettier, Husky, Git, GitHub, GitHub Enterprise, GitHub Actions, CI/CD, Jira, Docker
Practices: Reusable component libraries, accessibility (WCAG/ARIA), web security (XSS prevention), performance optimization, code review, Agile/Scrum
Full-stack (personal project): Node.js, NestJS, Prisma, PostgreSQL, Docker

Work Experience

Senior Frontend Engineer 2024/01 – Present
VOIS (Vodafone Intelligent Solutions) Egypt

React and TypeScript modernization - Vodafone Germany internal applications

- Migrating a large legacy vanilla JavaScript/jQuery application served by an OpenText CMS to React and TypeScript, rebuilding features one at a time as independently mountable modules that replace legacy widgets in place, so the React and legacy applications run side by side instead of requiring a big-bang rewrite.
- Own frontend architecture for the migration: module structure and conventions, a typed API layer that cancels superseded requests so a slow response can never overwrite a newer one, cross-module communication through a typed callback store, and per-environment rollout flags with a kill switch so any module can be reverted independently.
- Built a reusable React and TypeScript data table replacing a legacy jQuery DataTables implementation and a separate JSON-driven table path, unifying both behind one component with sticky headers, global search, cascading column filters, merged-cell sorting, column visibility and pagination.
- Rebuilt the internal tools used by Vodafone Germany teams as React modules, including a customer number lookup, a roaming eligibility tool and a store locator, plus the typed callback bus that became the permanent integration API between them.
- Used the legacy codebase as the migration specification, extracting its business rules and covering each one in the Vitest and React Testing Library suites I wrote, so the migration could not silently change behavior; Storybook covers states that need an internal backend.

- Diagnosed high-impact defects invisible to a passing build and test suite, including a Vite dependency externalization issue that shipped a blank page, and an outage-handling flaw where a failed backend response was indistinguishable from a valid negative answer and could show an incorrect result to a user.
- Improved security, accessibility and build performance across ported modules: removed an XSS surface created by templated innerHTML, replaced misapplied ARIA roles with semantic markup and screen-reader text, and reworked the Vite build so a heavy vendor bundle no longer loads on pages that never use it.
- Enforced TypeScript strict mode and ESLint at a zero-warning threshold in the team's GitHub Enterprise CI pipeline, documented each module's API contracts and deliberate divergences from legacy behavior, and reviewed teammates' pull requests across both the legacy and React codebases.

Angular development - Vodafone Italy

- Developed and maintained customer-facing Vodafone web applications for the Italian market, including Payments, Offers, Invoices, Timeline, Top-up, Login, Registration and History modules, integrated with existing backend REST services.
- Built and maintained reusable components and refactored legacy code to improve readability, performance and long-term maintainability.
- Contributed to Angular version upgrades, migrating existing features while preserving functional parity and backward compatibility.
- Implemented complex state management and reactive data flows using RxJS, NgRx and Angular Signals.
- Took over regression and functional testing during QA team absences following formal handover, protecting release quality.

Software Engineer, Frontend 2022/05 – 2023/12

EVA pharma Egypt

- Built and shipped production web applications and business websites using HTML, CSS, JavaScript, Angular and React.
- Rebuilt React applications on Next.js to improve page performance and rendering behavior.
- Developed reusable component sets that shortened implementation time on subsequent projects.
- Collaborated with UX/UI designers and backend engineers to integrate frontend features with backend services.
- Provided technical guidance and onboarding support to junior developers joining the team.
- Selected projects: EVA Pharma corporate website; Curium corporate website; Acticolla landing page; Medsulto admin dashboard.

Software Engineer, Frontend 2021/05 – 2022/05

Baianat Egypt

- Translated UI/UX wireframes into responsive, SEO-friendly production markup using HTML and CSS.
- Integrated REST and GraphQL APIs into browser-compatible applications built with Angular and Vue.js.
- Designed and developed multiple admin dashboards backing production mobile applications.
- Diagnosed and fixed defects across several existing legacy projects, working incrementally inside unfamiliar codebases.
- Collaborated with product owners, backend engineers and QC to analyze requirements and validate delivered features.
- Selected projects: Kemitt e-commerce platform; twjeih e-learning platform; Aqarat real estate platform; admin dashboards (Aqarat, Printiro Designer, Printiro Vendor, Printiro Super Admin, MindMore, Facedoc).

Side Projects

Fantasy EG - fantasyeg.com

Nuxt 4, Vue 3, TypeScript, Pinia, NestJS, Prisma, PostgreSQL, Docker

- Designed, built and shipped a live fantasy football platform end to end as a solo project - player web application, marketing site, admin dashboard, REST API and deployment - running for the 2026/27 Egyptian Premier League season.
- Built the frontend in Nuxt 4 and Vue 3 with TypeScript: hybrid rendering (prerendered marketing pages, client-only application routes), an RTL-first bilingual Arabic/English interface with Arabic as the default locale, unit tests in Vitest and end-to-end tests in Playwright.
- Owned the full product beyond the frontend: product rules and data model, the NestJS/Prisma/PostgreSQL API, the admin dashboard, and self-hosted deployment on Docker with GitHub Actions pipelines across separate development and production environments.

Education

Bachelor of Computer and Information Sciences 2021

Faculty of Computer & Information Sciences - Mansoura University Egypt

Languages

- Arabic (Native)
- English (Professional working proficiency)
